

Gas Station Delivery App:

I want to create a simple, professional, and easy-to-use delivery app for my gas station/convenience store. The purpose of the app is to allow customers in our local delivery area to order products directly from our store and have them delivered to their home, workplace, hotel, campground, or other local address.

The app should be easy for customers to use and easy for our staff to manage.

Customer Side

Customers should be able to create an account using their name, phone number, email address, and password. Guest checkout would also be useful if possible.

Customers should be able to save their delivery address and have the app confirm whether their address is inside our delivery area.

The home screen should display our gas station name/logo, current promotions, featured products, popular products, categories, and an easy search bar.

Product Categories

We want the ability to create and edit our own categories. Categories may include:

- * Drinks
- * Pop
- * Energy drinks
- * Water
- * Coffee
- * Chips
- * Candy
- * Chocolate
- * Ice cream
- * Snacks
- * Grocery/basic household items
- * Automotive products
- * Windshield washer fluid
- * Ice
- * Firewood
- * Propane-related items where legally permitted
- * Convenience-store products
- * Seasonal products
- * Specials and promotions

We need full control from an administrator dashboard so we can add new categories whenever necessary.

Product Listings

Each product should have:

- * Product name
- * Product photo
- * Description
- * Price
- * Sale price if applicable
- * Category
- * Available/out-of-stock status
- * Quantity or size
- * Product options when needed
- * Maximum purchase quantity if necessary

Staff should be able to quickly mark an item as sold out so customers cannot order something we do not currently have.

Shopping Cart

Customers should be able to add multiple products to their cart and see:

- * Items ordered
- * Quantities
- * Individual prices
- * Subtotal
- * Taxes
- * Delivery fee
- * Discounts
- * Tip
- * Final total

Customers should be able to increase or decrease quantities before placing their order.

Delivery

We want to set our own delivery area.

The system should either use postal codes, distance from the gas station, or a map radius to determine whether we deliver to a customer's location.

We would like the option to have different delivery fees depending on distance.

For example:

0–5 km: one delivery price

5–10 km: another delivery price
10–20 km: another delivery price

We should be able to change these distances and prices ourselves.

We may also want the ability to offer free delivery when a customer spends over a certain amount.

Customers should be able to enter delivery instructions such as:

“Leave at front door”
“Call when you arrive”
“Side entrance”
“Meet me in the lobby”

Ordering

The checkout process should allow the customer to choose:

- * Delivery
- * Store pickup, if enabled

Customers should see an estimated delivery time before placing their order.

After an order is submitted, the customer should receive an order confirmation.

Order Tracking

Customers should be able to see the status of their order.

Suggested statuses:

1. Order received
2. Order confirmed
3. Preparing order
4. Ready for driver
5. Out for delivery
6. Delivered

If possible, customers should receive push notifications whenever the order status changes.

Eventually, we may want live driver tracking on a map, so the system should ideally be built in a way that allows this feature to be added.

Payments

Customers should be able to securely pay through the app.

Preferred payment options include:

cash

E-Transfer

We may also want an optional "Pay at Door" setting that the administrator can turn on or off.

The app should automatically calculate applicable taxes.

We need to be able to issue refunds or partial refunds when necessary.

Gas Station Delivery App

A simple and professional delivery app for our gas station/convenience store. Customers can browse products, place orders, and receive local delivery.

Customer App

- Sign up / login with name, phone, email, and password
- Guest checkout if possible
- Save delivery addresses
- Check whether an address is within the delivery area
- Browse categories and products
- Search products
- View promotions and featured products
- Add products to cart
- Increase/decrease quantity
- View subtotal, tax, delivery fee, discount, tip, and total
- Add delivery instructions
- Choose **Delivery** or **Store Pickup** if enabled
- See estimated delivery time
- Place order and receive confirmation
- View order history and order status
- Receive push notifications when order status changes

Products & Categories

Admin should be able to:

- Add/edit/delete categories
- Add/edit/delete products
- Upload product images
- Set price and sale price
- Set product size/quantity/options
- Mark products as available or out of stock
- Set maximum purchase quantity

Example categories:

Drinks, Pop, Energy Drinks, Water, Coffee, Chips, Candy, Chocolate, Ice Cream, Snacks, Grocery Items, Automotive Products, Ice, Firewood, Propane-related Items, Seasonal Products, and Specials.

Delivery

Admin should be able to set the delivery area using:

- Postal/ZIP code
- Distance/radius from the gas station

Different delivery fees can be set based on distance.

Example:

- 0–5 km → \$X
- 5–10 km → \$X
- 10–20 km → \$X

Admin should also be able to set a **free delivery amount**.

Orders

Order statuses:

Order Received → Confirmed → Preparing → Ready for Driver → Out for Delivery → Delivered

Staff should be able to view, manage, assign, and update orders from the admin dashboard.

Payment

Cash/hand payment only.

There will be **no online payment system or payment gateway**.

Payment options can include:

- Cash on Delivery
- Pay at Door
- Cash at Store Pickup

Admin Dashboard

Admin/staff should be able to manage:

- Products
- Categories

- Orders
- Customers
- Delivery areas
- Delivery fees
- Taxes
- Promotions
- Store pickup
- Delivery settings

The system should be built in a way that **live driver tracking can be added later**.
